

Topic

LC-GD-6-1-2020: Testing and demonstrating systemic innovations in support of the Farm-to-Fork Strategy

Competences / Expertise

The Institute for the Research in Agrifood Resources (INURA) in University of Extremadura (Spain) has more than 30 researchers specialised in the improvement of the quality of agricultural products by using natural resources as well as of the processing, conservation and/or commercial shelf-life to obtain high quality, safe and friendly-environmental food products.

Potential contributions of INURA to this topic:

- Agricultural and livestock systems with low or positive impact on environment
- Integrate the subsequent transformation evaluating more sustainable energy and environmental systems
- Provide innovative technologies for reduction of plant-origin food losses and waste by application of new control approaches (biopreservation, environmentfriendly pesticides...)
- Provide and validate effective ways to reduce food losses and waste by the valorization of by-products
- Development of healthy diets with the raw materials

INURA has experience in European programmes like PRIMA.
